

5 Reasons To Make PS Series Your Backup and Recovery Solution

1

Take advantage of storage consolidation for centralized backup.

Not just any storage consolidation – EqualLogic's iSCSI-based storage solution with enterprise quality data services, performance, high availability, and scalability. Centralized backup simplifies the process, protects all your data, and eases management.

2

Virtually unlimited snapshots for better backup.

Backing up from data using snapshots helps to minimize lost work, improve recovery time, and ensure data integrity. Our automated snapshot functionality gives you as many point-in-time copies of data as you need, for heterogeneous servers throughout your enterprise. While other solutions limit the number of snapshots to 64 or 128, our arrays support up to 10,000. Using snapshots for backup, testing, and other functions lets your data work harder for your business.

3

PS Series snapshots shrink backup windows and provide instant restore.

Instead of bringing applications down for long periods during backup, you can take a snapshot in seconds, return to production operations, and then backup the snapshot. Now, the time it takes to run backups doesn't matter, because you are not interrupting business. Restore is equally easy and fast – mount any snapshot and instantly restore that data. Automated scheduling further reduces backup management tasks.

4

Application-consistent snapshots ensure data integrity.

EqualLogic PS Series arrays support application-aware snapshots, allowing you to execute them online and not worry about getting bad backup data. Without application-awareness, you risk backing up data during processing that turns out to be unusable.

5

Flexible access control enables offloaded backups.

You can create the snapshot on your application server and have another server access it for backup – this feature reduces backup windows even further, and offloads processing from your application servers.
